

Indian Telecommunication Security Assurance Requirements (ITSAR)

Access and Mobility Management Function (AMF) of 5G

Draft For Comments

Release Date:

Version: 1.0.0

Enforcement Date:

Security Assurance Standards Facility
National Centre For Communication Security
Department of Telecommunications, Bengaluru-560027

About NCCS

National Centre for communication Security (NCCS), with headquarters at Bengaluru was set up in 2018 with the objective to establish and operationalize a framework of security testing and certification within the country. Security Assurance Standards (SAS) division of NCCS is mandated to prepare Telecom security requirements/standards called Indian Telecom Security Assurance Requirements (ITSAR) that addresses the country specific security needs in telecommunication landscape and notify the same.

Chapter 1 – Introduction	1
Chapter 2 – Common Security Requirements	4
Chapter 3 Specific Security Requirements	45
Annexure-I (Definition)	51
Annexure-II(Acronyms)	54
Annexure-III(List of Submissions)	56
Annexure-IV (References)	57
Annexure-V (List of Cryptographic Controls)	58

A) Outline:

The objective of this document is to present a comprehensive, country-specific security requirements for the Access and Mobility Management (AMF) network function of 5G Core. As a control plane function, AMF terminates the interfaces from access network and User Equipment (UE). Its main functionalities include Registration management, Connection management, Reachability management, access authentication, access authorization, support for Lawful Intercept and network slice. AMF provides these functionalities for both 3GPP and non-3GPP accesses.

The specifications produced by various regional/ international standardization bodies/ organizations/associations like 3GPP, ITU-T, ISO, ETSI, IEEE, IETF, NGMN, O-RAN, TIP, IRTF, GSMA, SDSI along with the country-specific security requirements are the basis for this document.

This document commences with a brief description of 5G system architecture, AMF and its functionalities and then proceeds to address the common and entity specific security requirements of AMF.

B) Scope:

This document targets on the security requirements of the 5G Core AMF network function as defined by 3GPP. This document does not cover the security requirements at the virtualization and ~~hardware platform~~ layers.

The regulations regarding Remote Access and Lawful Interceptions are not part of this ITSAR. The requirements specified here are binding both on operators (aka Telecommunication Service Provider- TSP) and network equipment providers (aka OEMs- Original Equipment Manufacturer).

C) Conventions

1. Must or shall or required denotes the absolute requirement of a particular clause of ITSAR.
2. Must not or shall not denote absolute prohibition of a particular clause of ITSAR.
3. Should or Recommended denotes that the particular clause of ITSAR may be ignored under justifiable circumstances but after careful examination of its implications.
4. Should not or not Recommended denotes the opposite meaning of (3) above.

Chapter 1 – Overview

Introduction: The fifth generation of mobile technologies - 5G - is expected to connect people, things, data, applications, transport systems and cities in a smart networked communication environment. 5G is standardized by the 3rd Generation Partnership Project (3GPP) and the requirement framework for 5G are specified by ITU under IMT-2020. The usage scenario/use cases identified for 5G are i) Enhanced Mobile Broadband (eMBB) ii) Massive Machine Type Communication (mMTC) and iii) Ultra Reliable and Low Latency Communications (URLLC).

5G Architecture: The generic 5G system (5GS) architecture consists of User Equipment, Radio Access Network supporting New Radio (NR) and the cloud-native 5G core networks (5G-CN). 5G base station is called as Next Generation Node B (gNB). The deployment strategies possible are Non Stand Alone (NSA) and Stand Alone (SA). SA denotes 5G NR connecting to 5G CN. In NSA mode, 5G NR gets connected to 4G EPC but uses LTE as anchor in control plane.

5G Core Network: Core network is the central part of mobile network. 5G Core network provides authentication, security, mobility management, session management services and enables the subscribers to avail the services. These functionalities are specified as “network functions”. Some of the important core network functions are 1) AMF 2) SMF 3) AuSF 4) UPF 5) AF 6) NEF 7) NRF 8) PCF 9) UDM 10) UDR

The salient features of 5G Core are

- 1) Separation of user plane and control plane
- 2) Service Based Architecture (SBA)
- 3) Network Slicing
- 4) Network function virtualization and Software Define Networking
- 5) Automation
- 6) Access Agnostic
- 7) Framework for policy control and support of QoS
- 8) Secure exposure of network functions to 3rd party providers

In a SBA framework, the individual elements are defined as Network Functions (NFs) instead of Network entities. Through Service Based Interface (SBI) each of the NFs consumes services offered by other service producer-other NFs. RESTful APIs are used in 5G SBA which use HTTP/2 as application layer protocol.

Access and Mobility Management Function(AMF): AMF can be compared to MME of LTE which handles both mobility and session management functions. However, in 5G mobility management is handled by AMF and SMF handles the session management.

The Access and Mobility Management function (AMF) includes the following functionality. Some or all of the AMF functionalities may be supported in a single instance of an AMF:

- Termination of RAN CP interface (N2).
- Termination of NAS (N1), NAS ciphering and integrity protection.
- Registration management.
- Connection management.
- Reachability management.
- Mobility Management.
- Lawful intercept (for AMF events and interface to LI System).
- Provide transport for SM messages between UE and SMF.
- Transparent proxy for routing SM messages.
- Access Authentication.
- Access Authorization.
- Provide transport for SMS messages between UE and SMSF.
- Security Anchor Functionality (SEAF).
- Location Services management for regulatory services.
- Provide transport for Location Services messages between UE and LMF as well as between RAN and LMF.
- EPS Bearer ID allocation for interworking with EPS.
- UE mobility event notification.
- S-NSSAIs per TA mapping notification.
- Support for Control Plane CIoT 5GS Optimization.
- Support for User Plane CIoT 5GS Optimization.
- Support for restriction of use of Enhanced Coverage.
- Provisioning of external parameters (Expected UE Behaviour parameters or Network Configuration parameters).

- Support for Network Slice-Specific Authentication and Authorization.
- Support for charging.

In addition to the functionalities of the AMF described above, the AMF may include the following functionality to support non-3GPP access networks:

- Support of N2 interface with N3IWF/TNGF.
- Support of NAS signaling with a UE over N3IWF/TNGF.
- Support of authentication of UEs connected over N3IWF/TNGF.
- Management of mobility, authentication, and separate security context state(s) of a UE connected via a non-3GPP access or connected via a 3GPP access and a non-3GPP access simultaneously.
- Support of co-ordinated RM management context valid over a 3GPP access and a Non 3GPP access.
- Support of dedicated CM management contexts for the UE for connectivity over non-3GPP access.

In addition to the functionalities of the AMF described above, the AMF may include policy related functionalities.

The AMF uses the N14 interface for AMF re-allocation and AMF to AMF information transfer. This interface may be either intra-PLMN or inter-PLMN (e.g. in the case of inter-PLMN mobility).

In addition to the functionality of the AMF described above, the AMF may include the following functionality to support monitoring in roaming scenarios:

- Normalization of reports according to roaming agreements between VPLMN and HPLMN (e.g. change the location granularity in a report from cell level to a level that is appropriate for the HPLMN); and
- Generation of charging/accounting information for Monitoring Event Reports that are sent to the HPLMN.

In addition to the functionality of the AMF described above, the AMF may provide support for Network Slice restriction and Network Slice instance restriction based on NWDAF analytics.

In addition to the functionalities of the AMF described above, the AMF may provide support for the Disaster Roaming.

In addition to the functionalities of the AMF described above, the AMF may also include following functionalities to support Network Slice Admission Control:

- Support of NSAC for maximum number of UEs.

In addition to the functionality of the AMF described above, the AMF may include the following functionality to support SNPNs:

- Support for Onboarding of UEs for SNPNs.

Architectural representation: 3GPP Release specifies 5G Core network functions in two ways i) reference point based architecture and ii) service based architecture. Pl refer Figure 1.

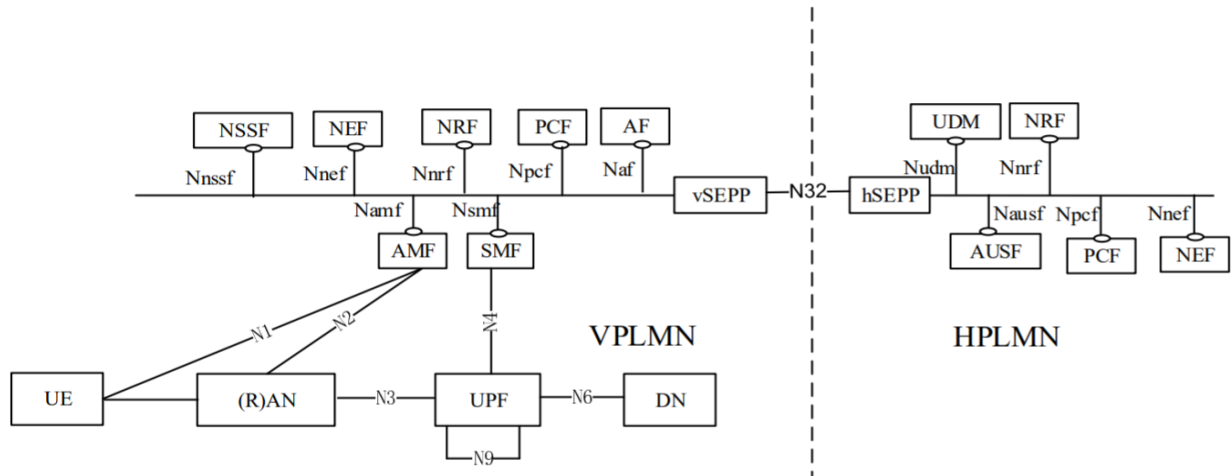

Figure 1: Roaming 5G System architecture- local breakout scenario in service-based interface.

As shown in Figure 1, AMF is connected to UE with the N1 interface. N1 interface messages are physically passed through the access network(AN) to show the logical connection; a direct connection in the service-based architecture is illustrated in Figure 1. The N2 interface in Figure 1 is the interface between the Access Network and AMF.

AMF plays an important role in ciphering the N1 NAS messages. NAS message's Confidentiality and Integrity protection is a key requirement that AMF will fulfill. When a UE establishes communication with the core network, the Subscriber privacy is also taken into account with the help of AMF. The security anchor function (SEAF) provides authentication via the AMF in the serving network.

AMF Security: The 3GPP TS 33.501 includes requirements for the AMF as for signaling data confidentiality, signaling data integrity, subscriber privacy and requirements on Security Anchor Function (SEAF). Security for Service Based Architecture, protection at management plane, protection at control plane, protection at data plane, protection at synchronization plane, platform security, secure implementation of crypto modules & algorithms are the some of the base line security requirements.

Chapter 2 – COMMON SECURITY REQUIREMENTS

Section 1: Access and Authorization

2.1.1 Management Protocols Mutual Authentication

Requirement:

The network product management shall support mutual authentication mechanisms, the mutual authentication mechanism can rely on the protocol used for the interface itself or other means.

Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” shall only be used for AMF management and maintenance.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.4.1]

2.1.2 Management Traffic Protection

Requirement:

AMF management traffic shall be protected strictly using secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.2.4]

2.1.3 Role-based access control policy

Requirement:

AMF shall support Role-Based Access Control (RBAC). A role-based access control system uses a set of controls that determines how users interact with domains and resources.

The RBAC system controls how users or groups of users are allowed access to the various domains and what type of operation they can perform, i.e., the specific operation command

or command group(e.g View,Modify ,Execute). AMF supports RBAC with minimum of 3 user roles, in particular, for OAM privilege management for AMF Management and Maintenance, including authorization of the operation for configuration data and software via the network product console interface.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.3.4.6.2]

2.1.4. User Authentication – Local/Remote

Requirement:

The various user and machine accounts on a system shall be protected from misuse. To this end, an authentication attribute is typically used, which, when combined with the user name, enables unambiguous authentication and identification of the authorized user.

Authentication attributes include

- Cryptographic keys
- Token
- Passwords

This means that authentication based on a parameter that can be spoofed is not permitted. Exceptions are attributes that cannot be faked or spoofed by an attacker.

Minimum two of the above Authentication attributes shall be mandatorily combined for protecting all the accounts from misuse. An exception to this requirement is local access and machine accounts where atleast one authentication attribute shall be supported.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.2.1]

2.1.5 Remote login restrictions for privileged users

Requirement:

Login to AMF as root or equivalent highest privileged user shall be limited to the system console only. Root user will not be allowed to login to AMF remotely.

This remote root user access restriction is also applicable to application software's / tools such as TeamViewer, desktop sharing which provide remote access to the AMF.

[Reference TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.3.2.6]

2.1.6 Authorization Policy

Requirement:

The authorizations for accounts and applications shall be reduced to the minimum required for the tasks they have to perform.

Authorizations to a system shall be restricted to a level in which a user can only access data and use functions that he needs in the course of his work. Suitable authorizations shall also be assigned for access to files that are components of the operating system or of applications or that are generated by the same (e.g. configuration and logging files).

Alongside access to data, execution of applications and components shall also take place with rights that are as low as possible. Applications should not be executed with administrator or system rights.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 . Section 4.2.3.4.6.1]

2.1.7 Unambiguous identification of the user & group accounts removal

Requirement:

Users shall be identified unambiguously by the AMF.

AMF shall support the assignment of individual accounts per user, where a user could be a person, or, for Machine Accounts, an application, or a system.

AMF shall not enable the use of group accounts or group credentials, or sharing of the same account between several users.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Sections 4.2.3.4.1.2]

Section 2: Authentication Attribute Management

2.2.1 Authentication Policy

Requirement:

The usage of a system function without successful authentication on basis of the user identity and at least two authentication attribute (e.g. password, certificate) shall be prevented. For machine accounts and local access one authentication attribute will be sufficient. System functions comprise, for example network services (like SSH, SFTP, Web services), local

access via a management console, local usage of operating system and applications. This requirement shall also be applied to accounts that are only used for communication between systems

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.1.1]

2.2.2 Authentication Support – External

Requirement:

If the AMF supports external authentication mechanism such as AAA server (for authentication, authorisation and accounting services), then the communication between AMF and the external authentication entity shall be protected using the authentication and related service protocols built strictly using the Secure cryptographic controls prescribed in Table1 of the latest document “ Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

2.2.3 Protection against brute force and dictionary attacks

Requirement:

A protection against brute force and dictionary attacks that hinder authentication attribute guessing shall be implemented in AMF.

Brute force and dictionary attacks aim to use automated guessing to ascertain authentication attribute for user and machine accounts.

Various measures or a combination of the following measures can be taken to prevent this:

(i) Using the timer delay (this delay could be the same or increased depending the operator's policy for each attempt) for each newly entered password input following an incorrect entry ("tar pit").

(ii) Blocking an account following a specified number of incorrect attempts. However, it has to be taken into account that this solution needs a process for unlocking and an attacker can force this to deactivate accounts and make them unusable.

(iii) Using an authentication attribute blacklist to prevent vulnerable passwords.

(iv) Using CAPTCHA to prevent automated attempts (often used for Web applications).

In order to achieve higher security, two or more of the measures indicated above shall be mandatorily supported by AMF. An exception to this requirement is machine accounts.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.3.3]

2.2.4 Enforce Strong Password

Requirement:

(a) The configuration setting shall be such that a AMF shall only accept passwords that comply with the following complexity criteria:

(i) Absolute minimum length of 8 characters (shorter lengths shall be rejected by the AMF). It shall not be possible setting this absolute minimum length to a lower value by configuration.

(ii) Password shall mandatorily comprise all the following four categories of characters:

- at least 1 uppercase character (A-Z)
- at least 1 lowercase character (a-z)
- at least 1 digit (0-9)
- at least 1 special character (e.g. @;!\$.)

b) The minimum length of characters in the passwords and the set of allowable special characters shall be configurable by the operator. The special characters may be categorized in sets according to their Unicode category.

c) If a central system is used for user authentication password policy, then additional assurance shall be provided that the central system enforces the same password complexity rules as laid down for the local system in this sub-clause.

d) If a central system is not used for user authentication, the assurance on password complexity rules shall be performed on the AMF.

e) When a user is changing a password or entering a new password, AMF /central system checks and ensures that it meets the password requirements. Above requirements shall be applicable for all passwords used (e.g. application-level, OS-level, etc.).

Password shall not be stored in clear text in the system; passwords shall be salted and hashed.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section 4.2.3.4.3]

2.2.5 Inactive Session timeout

Requirement:

An OAM user interactive session shall be terminated automatically after a specified period of inactivity. It shall be possible to configure an inactivity time-out period.

AMF shall monitor inactive sessions of administrative login users and initiate session locking mechanism based on user configurable timers. Unlocking the session shall be permissible only by authentication. If the inactivity period further continues for a defined period, Session /user ID time out must occur after this inactivity.

The timer values can be admin configurable as per requirement, normally set between 2 to 5 minutes.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.5.2]

2.2.6 Password Changes

Requirement:

If a password is used as an authentication attribute, then the system shall offer a function that enables a user to change his password at any time. When an external centralized system for user authentication is used it should be possible to implement this function on this system.

Password change shall be enforced after initial login.

AMF shall enforce password change based on password management policy.

In particular, the system shall enforce password expiry. AMF shall support a configurable period for expiry of passwords.

Previously used passwords shall not be allowed upto a certain number (Password History).

The number of disallowed previously used passwords shall be:

- Configurable;
- Greater than 0;
- And its minimum value shall be 3. This means that the AMF shall store at least the three previously set passwords. The maximum number of passwords that the AMF can store for each user is up to the manufacturer.

When a password is about to expire, a password expiry notification shall be provided to the user.

Above requirements shall be applicable for all passwords used(e.g. application-level, OS-level, etc.). An exception to this requirement is machine accounts.

AMF to have in-built mechanism to support this requirement.

If a central system is used for user authentication password policy, then additional assurance shall be provided that the central system enforces the same password change policies as laid down for the local system in this subclause.

And if a central system is not used for user authentication, the assurance on password changes rules shall be performed on the AMF.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.3.2]

2.2.7 Protected Authentication feedback

Requirement:

The Authentication attribute shall not be displayed in such a way that it could be seen and misused by a casual local observer. Typically, the individual characters of the password are replaced by a character such as "*".

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.3.4]

2.2.8 Removal of predefined or default authentication attributes

Requirement:

Predefined or default authentication attributes shall be deleted or disabled.

Normally, authentication attributes such as password or cryptographic keys will be preconfigured from producer, OEM or developer of a system. Such authentication attributes shall be changed by automatically forcing a user to change it on 1st time login to the system or the OEM provides instructions on how to manually change it.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.4.2.3]

2.2.9 Logout function

Requirement:

The system shall have a function that allows a signed-in user to logout at any time. All processes under the logged-in user ID shall be terminated on logout. The network product shall be able to continue to operate without interactive sessions.

Only for debugging purposes, processes under a logged-in user ID may be allowed to continue to run after detaching the interactive session.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.5.1]

2.2.10 Policy regarding consecutive failed login attempts

Requirement:

- a) The maximum permissible number of consecutive failed user account login attempts should be configurable by the operator. The definition of the default value set at manufacturing time for the maximum number of failed user account login attempts shall be less than or equal to 8, typically 5. After the maximum permissible number of consecutive failed user account login attempts is exceeded by a user, there shall be a block delay in allowing the user to attempt login again. This block delay and the capability to set the period of the block delay, e.g., double the delay, or 5 minutes delay, or 10 minutes delay, after each login failure should be configurable by the operator. The default value set at manufacturing time for this delay shall be greater than or equal to 5 sec.
- b) If supported, infinite (permanent) locking of an account that has exceeded the maximum permissible number of consecutive failed user account login attempts should also be possible via configuration, with the exception of administrative accounts, which shall get only temporarily locked.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.3.4.5]

Section 3: Software Security

2.3.1 Secure Update

Requirement:

For software updates, AMF shall support software package integrity validation via cryptographic means, e.g. digital signature, code signing certificate (valid and not time expired) and using Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

To this end, the AMF has a list of public keys or certificates of authorized software sources, and uses the keys to verify that the software update is originated from only these sources.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.3.5]

2.3.2 Secure Upgrade

Requirement:

(i) AMF Software package integrity shall be validated in the installation /upgrade stage.

(ii) AMF shall support software package integrity validation via cryptographic means, e.g., digital signature, code signing certificate (valid and not time expired), and using Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only. To this end, the AMF has a list of public keys or certificates of authorized software sources and uses the keys to verify that the software update originated from only these sources.

(iii) Tampered software shall not be executed or installed if the integrity check fails.

(iv) A security mechanism is required to guarantee that only authorized individuals can initiate and deploy a software upgrade and modify the list mentioned in (ii) above.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.3.5]

2.3.3 Source code security assurance

Requirement:

a) OEM shall follow best security practices including secure coding for software development. Source code shall be made available either at TSTL premises or at the mutually agreed location for source code review by the designated TSTL. It may be supported by furnishing the Software Test Document (STD).

b) Also, OEM shall submit the undertaking as below:

(i) Industry standard best practices of secure coding have been followed during the entire software development life cycle of the AMF Software which includes OEM developed code, third party software and open source code libraries used/embedded in the AMF.

(ii) AMF software shall be free from CWE top 25 and OWASP top10 security weaknesses on the date of offer of product to designated TSTL for testing. For other security weaknesses, OEM shall give mitigation plan.

(iii) The binaries for AMF and upgrades/updates thereafter generated from the source code are free from all known security vulnerabilities stated in bullet (ii) above.

2.3.4 Known Malware and backdoor Check

Requirement:

OEM shall submit an undertaking stating that AMF is free from all known malware and backdoors as on the date of offer of AMF to designated TSTL for testing and shall submit their internal Malware Test Document (MTD) of the AMF to the designated TSTL.

2.3.5 No unused software

Requirement:

Software components or parts of software which are not needed for operation or functionality of the AMF shall not be present.

Orphaned software components /packages shall not be present in AMF.

OEM shall provide the list of software that are necessary for AMF's operation.

In addition, OEM shall furnish an undertaking as "AMF does not contain Software that is not used in the functionality of AMF"

[Reference: TSDSI STD T1.3GPP 33.117 -16.7.0 V.1.0.0. Section 4.3.2.3]

2.3.6 Unnecessary Services Removal

Requirement:

AMF shall only run protocol handlers and services which are needed for its operation and which do not have any known security vulnerabilities. By default, all other ports and services will be permanently disabled. AMF Shall not support following services

- FTP
- TFTP
- Telnet
- rlogin, RCP, RSH
- HTTP
- SNMPv1 and v2
- SSHv1
- TCP/UDP Small Servers (Echo, Chargen, Discard and Daytime)
- Finger
- BOOTP server

- Discovery protocols (CDP, LLDP)
- IP Identification Service (Identd)
- PAD
- MOP

Any other protocols, services that are vulnerable are also to be permanently disabled. Full documentation of required protocols and services (communication matrix) of the AMF and their purpose needs to be provided by the OEM as prerequisite for the test case.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.3.2.1]

2.3.7 Restricting System Boot Source

Requirement:

The AMF can boot only from the memory devices intended for this purpose.

[Reference- TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section- 4.2.3.3.2]

2.3.8 Secure Time Synchronization

Requirement:

AMF shall provide reliable time and date information provided through NTP/PTP server.

AMF shall establish secure communication channel with the NTP/PTP server.

AMF shall establish secure communication channel strictly using Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” with NTP/PTP server.

AMF shall generate audit logs for all changes to time settings.

2.3.9 Restricted reachability of services

Requirement:

The AMF shall restrict the reachability of services such that they can be reached only on interfaces meant for the purpose. On interfaces where services are active, the reachability should be limited to legitimate communication peers.

Administrative services (e.g. SSH, HTTPS, RDP) shall be restricted to interfaces in the management plane for separation of management traffic from user traffic.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section 4.3.2.2]

2.3.10 Self Testing

Requirement:

AMF shall perform self-tests (integrity of the firmware and software as well as correct operation of cryptographic Module as per security requirement area of “self-test” of FIPS-140-2 or Later version etc.) to identify failures in its security Mechanisms during i) power on ii) when Administrator Instructs iii) Periodic, with period configurable and iv) at the time of restart.

Section 4: System Secure Execution Environment

2.4.1 No unused functions

Requirement:

Unused functions i.e the software and hardware functions which are not needed for operation or functionality of the AMF shall be deactivated in the AFM's software and/or hardware.

The list of hardware and software functions installed in the system shall match with the ones that have been mentioned and deemed necessary for the operation of the AMF.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.3.2.4]

2.4.2 No unsupported components

Requirement:

OEM to ensure that the AMF shall not contain software and hardware components that are no longer supported by them or their 3rd Parties including the open source communities, such as components that have reached end-of-life or end-of-support. An undertaking in this regard shall be given by OEM.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.3.2.5]

2.4.3 Avoidance of Unspecified mode of Access

Requirement:

AMF shall not contain any wireless access mechanism which is unspecified or not declared.

An undertaking shall be given by the OEM as follows:

"The AMF does not contain any wireless, optical, magnetic or any other component that may be used as a covert channel"

Section 5: User Audit

2.5.1 Audit trail storage and protection

Requirement:

The security event log shall be access controlled (file access rights) such that only privilege users including the administrator have access to read the log files. The only allowed operations on security event log are archiving/saving and viewing.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.6.3]

2.5.2 Audit Event Generation

Requirement:

The AMF shall log all important Security events with unique System Reference details as given in the Table below.

AMF shall record within each audit record at least information pertaining to Date and time of the event, type of event, subject identity, and the outcome (success or failure) of the event.

Additional audit record information, depending on the audit event, shall also be provided as given in the Table below:

Event (Mandatory optional)	Types or	Description	Event data to be logged
Incorrect login attempts(Mandatory)	login	Records any user incorrect login attempts to the TTE.	Username Source (IP address) if remote access

		Outcome of event (Success or failure)
		Timestamp
Administrator access(Mandatory)	Records any access attempts to accounts that have system privileges.	Username,
		Timestamp,
		Length of session
		Outcome of event (Success or failure)
		Source (IP address) if remote access
Account administration(Mandatory)	Records all account administration activity, i.e. configure, delete, copy, enable, and disable.	Administrator username,
		Administered account,
		Activity performed (configure, delete, enable and disable)
		Outcome of event (Success or failure)
		Timestamp
Resource Usage (Mandatory)	Records events that have been triggered when system parameter values such as disk space, CPU load over a longer period have exceeded their defined thresholds.	Value exceeded,
		Value reached
		(Here suitable threshold values shall be defined depending on the individual system.)
		Outcome of event (Threshold Exceeded)
		Timestamp
Configuration change(Mandatory)	Changes to configuration of the network device	Change made
		Timestamp
		Outcome of event (Success or failure)
		Username
Reboot/shutdown/crash(Mandatory)	This event records any action on the network device/TTE that forces a reboot or shutdown OR where the network device/TTE has crashed.	Action performed (boot, reboot, shutdown, etc.)
		Username (for intentional actions)
		Outcome of event (Success or failure)
		Timestamp

Interface status change(Mandatory)	Change to the status of interfaces on the network device/TTE (e.g. shutdown)	Interface name and type
		Status (shutdown, down missing link, etc.)
		Outcome of event (Success or failure)
		Timestamp
Change of group membership or accounts (Optional)	Any change of group membership for accounts	Administrator username,
		Administered account,
		Activity performed (group added or removed)
		Outcome of event (Success or failure)
		Timestamp.
Resetting Passwords (Optional)	Resetting of user account passwords by the Administrator	Administrator username
		Administered account
		Activity performed (configure, delete, enable and disable)
		Outcome of event (Success or failure)
		Timestamp
Services (Optional)	Starting and Stopping of Services (if applicable)	Service identity
		Activity performed (start, stop, etc.)
		Timestamp
		Outcome of event (Success or failure)
X.509 Certificate Validation (Optional)	Unsuccessful attempt to validate a certificate	Timestamp
		Reason for failure
		Subject identity
		Type of event
Secure Update (Optional)	Attempt to initiate manual update, initiation of update, completion of update	User identity
		Timestamp
		Outcome of event (Success or failure)
		Activity performed
Time change(Mandatory)	Change in time settings	Old value of time
		New value of time

		Timestamp
		origin of attempt to change time (e.g.IP address)
		Subject identity
		Outcome of event (Success or failure)
		User identity
Session unlocking/termination (Optional)	Any attempts at unlocking of an interactive session, termination of a remote session by the session locking mechanism, termination of an interactive session.	User identity (wherever applicable)
		Timestamp
		Outcome of event (Success or failure)
		Subject identity
		Activity performed
		Type of event
Trusted Communication paths with IT entities such as Authentication Server, Audit Server, NTP Server, etc. and for authorised remote administrators (Optional)	Initiation, Termination and Failure of trusted Communication paths	Timestamp
		Initiator identity (as applicable)
		Target identity (as applicable)
		User identity (in case of Remote administrator access)
		Type of event
		Outcome of event (Success or failure, as applicable)
Audit data changes(Optional)	Changes to audit data including deletion of audit data	Timestamp
		Type of event (audit data deletion, audit data modification)
		Outcome of event (Success or failure)
		Subject identity
		User identity
		origin of attempt to change time (e.g.IP address)
		Details of data deleted or modified
Port Scan attempts		Date

	Any attempt to scan the network interface shall lead to triggering of logging of the appropriate parameters	Time Stamp
		Source IP address
		Destination Port address
User Login (Mandatory)	All use of Identification and authentication mechanisms.	User identity
		Origin of attempt(IP address)
		Outcome of event (Success or failure)
		Timestamp

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.6.1]

2.5.3 Secure Log Export

Requirement:

(I) (a) The AMF shall support forwarding of security event logging data to an external system by push or pull mechanism.

(b) Log functions should support secure uploading of log files to a central location or to a system external for the AMF.

(II) AMF shall be able to store the generated audit data itself may be with limitations.

(III) AMF shall alert administrator when its security log buffer reaches configured threshold limit.

(IV) In the absence of external system (due to loss of connectivity or due to node failure or due to any other reasons), AMF shall have mechanism to store audit data locally. AMF shall have sufficient memory (minimum 100 MB) allocated for this purpose. OEM shall submit justification document for sufficiency of local storage requirement.

(V) Secure Log export shall comply the secure cryptographic controls prescribed in Table1 of the latest document "Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)" only

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.6.2]

2.5.4 Logging access to personal data

Requirement:

In some cases, access to personal data in a clear text might be required. If such access is required, access to this data shall be logged, and the log shall contain who accessed what data without revealing personal data in clear text. When for practical purposes, such logging is

not available, a coarser grain logging is allowed. In some cases, the personal data stored in the log files may allow the direct identification of a subscriber. In such cases, the revealed personal information may not expose the subscriber to any kind of privacy violation.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.2.5]

Section 6: Data Protection

2.6.1 Cryptographic Based Secure Communication

Requirements:

AMF shall Communicate with the connected entities strictly using the secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

OEM shall submit to TSTL, the list of the connected entities with AMF and the method of secure communication with each entity with details of interface, protocol stack implemented, configuration, detailed procedure of establishing the communication with each entity and any other details required for verifying this requirement.

2.6.2 Cryptographic Module Security Assurance

Requirement:

Cryptographic module embedded inside the AMF (in the form of hardware, software or firmware) that provides all the necessary security services such as authentication, integrity and confidentiality is designed and implemented in compliance with FIPS 140-2 or later as prescribed by NIST standards.

Till further instructions, this clause will be considered ‘complied’ by submission of an undertaking by the OEM in specified format along with self-certified test reports.

An undertaking is to be submitted by the OEM mentioning that “Cryptographic module embedded inside the AMF (in the form of hardware, software or firmware) that provides all the necessary security services such as authentication, integrity and confidentiality is designed and implemented in compliance with FIPS 140-2 or later as prescribed by NIST standards”.

OEM shall also submit cryptographic module testing document and the detailed self / Lab test report along with test results for scrutiny.

2.6.3. Cryptographic Algorithms implementation Security Assurance

Requirement:

Cryptographic algorithm implemented inside the Crypto module of AMF shall be in compliance with the respective FIPS standards (for the specific crypto algorithm).

Till further instructions, this clause will be considered 'complied' by submission of an undertaking by the OEM in specified format along with self-certified test reports

An undertaking is to be submitted by the OEM mentioning that "Cryptographic algorithm implemented inside the Crypto module of AMF is in compliance with the respective FIPS standards (for the specific crypto algorithm embedded inside the AMF)"

OEM shall submit cryptographic algorithm implementation testing document and the detailed self / Lab test report along with test results for scrutiny.

2.6.4. Protecting data and information – Confidential System Internal Data

Requirement:

a) When AMF is in normal operational mode (i.e., not in maintenance mode) there shall be no system function that reveals confidential system internal data in the clear text to users and administrators.

b) Access to maintenance mode shall be restricted only to authorised privileged user.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.2.2.]

2.6.5. Protecting data and information in storage

Requirement:

a) For sensitive data (persistent or temporary) in storage, read access rights shall be restricted. Sensitive files of AMF system that are needed for the functionality shall be protected against manipulation strictly using the Secure cryptographic controls prescribed in Table1 of the latest document "Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)" with appropriate non-repudiation controls.

b) In addition, the following rules apply for:

(i) Systems that need access to identification and authentication data in the clear/readable form e.g. in order to perform an activity/operation. Such systems shall not store this data in the clear/readable form, but scramble or encrypt it by implementation-specific means.

(ii) Systems that do not need access to sensitive data in the clear. Such systems shall hash this sensitive data strictly using the cryptographic controls prescribed in Table1 of the latest document "Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)" only.

(iii) Stored files in the TTE: Shall be protected against manipulation strictly using the NCCS approved Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section 4.2.3.2.3]

2.6.6 Protection against Copy of Data

Requirement:

- a) Without authentication, AMF shall not create a copy of data in use or data in transit.
 - b) Protective measures should exist against use of available system functions / software residing in AMF to create copy of data for illegal transmission.
 - c) The software functions, components in the AMF for creation of data copy are to be disabled or sufficiently secured to prevent illegal copy of data.
-

2.6.7 Protection against Data Exfiltration - Overt Channel

Requirement:

- a) AMF shall have mechanisms to prevent data exfiltration attacks for theft of data in use and data in transit.
 - b) Establishment of outbound overt channels such as, HTTPS, IM, P2P, Email etc. are to be forbidden if they are auto-initiated by / auto-originated from the TTE.
Session logs shall be generated for establishment of any session initiated by either user or AMF.
-

2. 6.8 Protection against Data Exfiltration - Covert Channel

Requirement:

- a) AMF shall have mechanisms to prevent data exfiltration attacks for theft of data in use and data in transit.
 - b) Establishment of outbound covert channels and tunnels such as DNS Tunnel, HTTPS Tunnel, ICMP Tunnel, TLS,SSL, SSH, IPSEC VPN, RTP Encapsulation etc. are to be forbidden if they are auto-initiated by / auto-originated from the AMF.
 - c) Session logs shall be generated for establishment of any session initiated by either user or AMF system.
-

Section 7: Network Services

2.7.1: Traffic Filtering – Network Level Requirement:

AMF shall provide a mechanism to filter incoming IP packets on any IP interface.

In particular the AMF shall provide a mechanism:

(i) To filter incoming IP packets on any IP interface at Network Layer and Transport Layer of the stack ISO/OSI.

(ii) To allow specified actions to be taken when a filter rule matches. In particular at least the following actions should be supported:

-Discard/Drop: the matching message is discarded, no subsequent rules are applied and no answer is sent back.

-Accept: the matching message is accepted.

-Account: the matching message is accounted for i.e. a counter for the rule is incremented. This action can be combined with the previous ones.

This feature is useful to monitor traffic before its blocking.

(iii) To enable/disable for each rule the logging for Dropped packets, i.e. details on messages matching the rule for troubleshooting.

(iv) To filter on the basis of the value(s) of source IP, destination IP and port addresses of protocol header.

(v) To reset the accounting.

(vi) The AMF shall provide a mechanism to disable/enable each defined rule.

[Reference– TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section 4.2.6.2.1]

2.7.2 Traffic Separation

Requirement:

The AMF shall support the physical or logical separation of traffic belonging to different network domains. For example, O&M traffic and control plane traffic belong to different network domains. See RFC 3871 for further information.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.5.1].

2.7.3: Traffic Protection –Anti-Spoofing:

Requirement:

AMF shall not process IP Packets if their source address is not reachable via the incoming interface. Implementation example: Use of "Reverse Path Filter" (RPF) provides this function.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.3.1.1]

2.7.4 GTP-C Filtering (when 5GC is interworking with EPC)

Requirement:

The following capability is conditionally required:

- For each message of a GTP-C-based protocol, it shall be possible to check whether the sender of this message is authorized to send a message pertaining to this protocol.
- At least the following actions should be supported when the check is satisfied:
 - Discard: the matching message is discarded.
 - Accept: the matching message is accepted.
 - Account: the matching message is accounted for, i.e., a counter for the rule is incremented. This action can be combined with the previous ones. This feature is useful to monitor traffic before its blocking.

This requirement is conditional in the following sense: It is required that at least one of the following two statements holds:

- AMF supports the capability described above, and this is stated in the product documentation.
- The AMF's documentation states that the capability is not supported and that the AMF needs to be deployed together with a separate entity that provides the capability described above.

[Reference– TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.6.2.3]

2.7.5 GTP-U Filtering

Requirement:

The following capability is conditionally required:

- For each message of a GTP-U-based protocol, it shall be possible to check whether the sender of this message is authorized to send a message pertaining to this protocol.
- At least the following actions should be supported when the check is satisfied:

- Discard: the matching message is discarded.
- Accept: the matching message is accepted.
- Account: the matching message is accounted for, i.e., a counter for the rule is incremented. This action can be combined with the previous ones. This feature is useful to monitor traffic before its blocking.

This requirement is conditional in the following sense: It is required that at least one of the following two statements holds:

- AMF supports the capability described above, and this is stated in the product documentation.
- The AFM's product documentation states that the capability is not supported and that the AMF needs to be deployed together with a separate entity which provides the capability described above.

[Reference– TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.6.2.4]

Section 8: Attack Prevention Mechanisms

2.8.1 Network Level and application-level DDoS

Requirement:

AMF shall have protection mechanism against Network level and Application-level DDoS attacks.

AMF shall provide security measures to deal with overload situations which may occur as a result of a denial of service attack or during periods of increased traffic. In particular, partial or complete impairment of system availability shall be avoided.

Potential protective measures include:

- Restricting of available RAM per application
- Restricting of maximum sessions for a Web application
- Defining the maximum size of a dataset
- Restricting CPU resources per process
- Prioritizing processes
- Limiting of amount or size of transactions of an user or from an IP address in a specific time range
- Limiting of amount or size of transactions to an IP address/Port Address in a specific time range

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.3.1]

2.8.2 Excessive Overload Protection

Requirement:

AMF shall act in a predictable way if an overload situation cannot be prevented. AMF shall be built in this way that it can react on an overload situation in a controlled way.

However, it is possible that a situation happens where the security measures are no longer sufficient. In such case it shall be ensured that AMF cannot reach an undefined and thus potentially insecure, state.

OEM shall provide a technical description of the AMF's Over Load Control mechanisms (especially whether these mechanisms rely on cooperation of other network elements e.g. RAN)

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.3.3.3]

2.8.3 Manipulated packets that are sent to an address of the network device shall not lead to an impairment of availability.

Requirement:

AMF shall not be affected in its availability or robustness by incoming packets from other network elements that are manipulated or differing the norm. This means that appropriate packets shall be detected as invalid and be discarded. The process shall not be affecting the performance of the AMF. This robustness shall be just as effective for a great mass of invalid packets as for individual or a small number of packets.

Examples of such packets are:

- Mass-produced TCP packets with a set SYN flag to produce half-open TCP connections (SYN flooding attack).
- Packets with the same IP sender address and IP recipient address (Land attack).
- Mass-produced ICMP packets with the broadcast address of a network as target address (Smurf attack).
- Fragmented IP packets with overlapping offset fields (Teardrop attack).
- ICMP packets that are larger than the maximum permitted size (65,535 Bytes) of IPv4 packets (Ping-of-death attack).
- Uncorrelated reply packets (i.e. packets which cannot be correlated to any request).

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.2.6.2.2]

Section 9: Vulnerability Testing Requirements

2.9.1 Fuzzing – Network and Application Level

Requirement:

It shall be ensured that externally reachable services of AMF are reasonably robust when receiving unexpected input.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 section 4.4.4]

2.9.2 Port Scanning

Requirement:

It shall be ensured that on all network interfaces of AMF, only documented ports on the transport layer respond to requests from outside the system.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.4.2]

2.9.3 Vulnerability Scanning

Requirement:

It shall be ensured that no known critical/high/medium (as per CVE-IDs of NIST-NVD) vulnerabilities (as on date of offer of TTE to the designated TTSL for testing) shall exist in the TTE. For low/uncategorized (as per CVE-IDs of NIST-NVD) category vulnerabilities remediation plan is to be provided.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 section 4.4.3]

Section 10: Operating System

2.10.1 Growing Content Handling

Requirement:

a) Growing or dynamic content shall not influence system functions.

b) A file system that reaches its maximum capacity shall lead to an event getting logged with appropriate message parameters and shall not stop AMF from operating properly. Therefore, countermeasures shall be taken to ensure that this scenario is avoided.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.4.1.1.1]

2.10.2 Handling of ICMP

Requirement :

Processing of ICMPv4 and ICMPv6 packets which are not required for operation shall be disabled on the AMF.

AMF shall not send certain ICMP types by default but it may support the option to enable utilization of these types which are marked as "Optional" in below table:

Type (IPv4)	Type (IPv6)	Description	Send	Respond to
0	128	Echo Reply	Optional (i.e. as automatic reply to "Echo Request")	N/A
3	1	Destination Unreachable	Permitted	N/A
8	129	Echo Request	Permitted	Optional
11	3	Time Exceeded	Optional	N/A
12	4	Parameter Problem	Permitted	N/A
N/A	2	Packet too Big	Permitted	N/A
N/A	135	Neighbor Solicitation	Permitted	Permitted
N/A	136	Neighbor Advertisement	Permitted	N/A

AMF shall not respond to, or process (i.e., do changes to configuration) under any circumstances certain ICMP message types as marked in the below table.

Type (IPv4)	Type (IPv6)	Description	Send	Respond to	Process (i.e., do changes to configuration)
5	137	Redirect	N/A	N/A	Not Permitted
13	N/A	Timestamp	N/A	Not Permitted	N/A
14	N/A	Timestamp Reply	Not Permitted (i.e. as automatic reply to "Timestamp")	N/A	N/A
N/A	133	Router Solicitation	N/A	Not Permitted	Not Permitted
N/A	134	Router Advertisement	N/A	N/A	Not Permitted

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.4.1.1.2.]

2.10.3 Authenticated Privilege Escalation only

Requirement:

Requirement:

AMF shall not support a privilege escalation method in interactive sessions (both CLI and GUI) which allows a user to gain administrator/root privileges from another user account without re-authentication.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.4.1.2.1]

2.10.4 System account identification

Requirement:

Each system account in AMF shall have a unique identification with appropriate non-repudiation controls

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section 4.2.4.2.2]

2.10.5 OS Hardening - Minimized kernel network functions

Requirement:

Kernel-based network functions not needed for the operation of the network element shall be deactivated. In particular, the following ones shall be disabled by default:

1. IP Packet Forwarding between different interfaces of the network product.
2. Proxy ARP
3. Directed broadcast
4. IPv4 Multicast handling
5. Gratuitous ARP messages

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section - 4.3.3.1.2]

2.10.6 No automatic launch of removable media

Requirement:

AMF shall not automatically launch any application when a removable media device is connected.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section - 4.3.3.1.3]

2.10.7 Protection from buffer overflows

Requirement:

AMF shall support mechanisms for buffer overflow protection. Documentation which describes these buffer overflow mechanisms and also how to check that they have been enabled and/or implemented shall be provided by OEM.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section - 4.3.3.1.5]

2.10.8 External file system mount restrictions

Requirement:

If normal users are allowed to mount external file systems (attached locally or via the network), OS-level restrictions shall be set properly in AMF in order to prevent privilege escalation or extended access permissions due to the contents of the mounted file systems. OS-level restrictions shall apply to normal users against mount / use of removable media devices (e.g. USB drive, CD ROM etc.) for data transfer.

[Reference- TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section - 4.3.3.1.6]

2.10.9 File-system Authorization privileges

Requirement:

AMF shall be designed to ensure that only users that are authorized to modify files, data, directories or file systems have the necessary privileges to do so.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 Section - 4.3.2.7]

2.10.10 Syn Flood Prevention

Requirement:

AMF shall support a mechanism to prevent Syn Flood attacks. This feature shall be enabled by default.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section - 4.3.3.1.4]

2.10.11 Handling of IP options and extensions

Requirement:

IP packets with unnecessary options or extension headers shall not be processed. IP options and extension headers (e.g., source routing) are only required in exceptional cases. So, all packets with enabled IP options or extension headers shall be filtered.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. Section - 4.2.4.1.1.3]

2.10.12 Restrictions on running Scripts / Batch-processes

Requirement:

Scheduled tasks for carrying out the activities such as taking the backups, monitoring disk space and system maintenance activities shall be executed by the privileged user such as administrator only. Similarly, AMF shall have feature to restrict Scripts / Batch-processes / Macros usage among various users. It shall be possible to administratively configure scheduled tasks usage i.e Cron-Job usage (permit / deny) among various users like Normal users, privileged users.

2.10.13 Restrictions on Soft-Restart

Requirement:

AMF shall restrict software-based system restart options usage among various users. The software reset / restart either through command or use of key-combinations like CTRL+ALT+DEL is not available to normal users for prevention of unintended / malicious trigger of system reset / restart.

Section 11: Web Servers

This entire section of the security requirements is applicable if the AMF supports **web management interface**.

2.11.1 HTTPS

Requirement:

The communication between Web client and Web server shall be protected strictly using the Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.2.5.1]

2.11.2 Webserver logging

Requirement:

Access to the AMF webserver (for both successful as well as failed attempts) shall be logged by AMF.

The web server log shall contain the following information:

- Access timestamp

- Source (IP address)
- Account (if known)
- Attempted login name (if the associated account does not exist)
- Relevant fields in http request. The URL should be included whenever possible.
- Status code of web server response

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.2.5.2]

2.11.3 HTTPS input validation

Requirement:

The AMF shall have a mechanism in place to ensure that web application inputs are not vulnerable to command injection or cross-site scripting attacks.

AMF shall validate, filter, escape, and encode user-controllable input before it is placed in output that is used as a web page that is served to other users.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.2.5.4]

2.11.4 No system privileges

Requirement:

No AMF web server processes shall run with system privileges.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.2]

2.11.5 No unused HTTPS methods

Requirement:

HTTPS methods that are not required for AMF operation shall be deactivated.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 section 4.3.4.3]

2.11.6 No unused add-ons

Requirement:

All optional add-ons and components of the web server shall be deactivated if they are not required for AMF operation.

In particular, CGI or other scripting components, Server Side Includes (SSI), and WebDAV shall be deactivated if they are not required.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.4]

2.11.7 No compiler, interpreter, or shell via CGI or other server-side scripting

Requirement:

If CGI (Common Gateway Interface) or other scripting technology is used, the CGI directory or other corresponding scripting directory shall not include compilers or interpreters.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.5]

2.11.8 No CGI or other scripting for uploads

Requirement:

If CGI or other scripting technology is used, the associated CGI/script directory shall not be used for uploads.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.6]

2.11.9 No execution of system commands with SSI

Requirement:

If Server Side Includes (SSI) is active, the execution of system commands shall be deactivated.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.7]

2.11.10 Access rights for web server configuration

Requirement:

Access rights for AMF web server configuration files shall only be granted to the owner of the web server process or to a user with system privileges.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 section 4.3.4.8]

2.11.11 No default content

Requirement:

Default content that is provided with the standard installation of the AMF web server shall be removed.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.9]

2.11.12 No directory listings

Requirement:

Directory listings (indexing) / "Directory browsing" shall be deactivated.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.10]

2.11.13 Web server information in HTTPS headers

Requirement:

The HTTPS header shall not include information on the version of the AMF web server and the modules/add-ons used.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.11]

2.11.14 Web server information in error pages

Requirement:

User-defined error pages and Error messages shall not include version information and other internal information about the AMF web server and the modules/add-ons used.

Default error pages of the AMF web server shall be replaced by error pages defined by the OEM.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.12]

2.11.15 Minimized file type mappings

Requirement:

File type or script-mappings that are not required for AMF operation shall be deleted.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.13]

2.11.16 Restricted file access

Requirement:

Restrictive access rights shall be assigned to all files which are directly or indirectly reside in the AMF web server's document directory.

In particular, the AMF web server shall not be able to access files which are not meant to be delivered.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0 section 4.3.4.14]

2.11.17 Execute rights exclusive for CGI/Scripting directory

Requirement:

If CGI or other scripting technology is used, only the CGI/Scripting directory is configured with execute rights. Other directories used or meant for web content do not have execute rights.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.3.4.15]

2.11.18 HTTP User session

Requirement:

To protect user sessions, AMF shall support the following session ID and session cookie requirements:

1. The session ID shall uniquely identify the user and distinguish the session from all other active sessions.
2. The session ID shall be unpredictable.
3. The session ID shall not contain sensitive information in clear text (e.g., account number, social security, etc.).
4. In addition to the Session Idle Timeout, AMF shall automatically terminate sessions after a configurable maximum lifetime. This maximum lifetime defines the maximum session span. When the maximum lifetime expires, the session shall be closed, the session ID shall be deleted and the user shall be forced to (re)authenticate in the web application and to establish a new session. The default value for this maximum lifetime shall be set to 8 hours.
5. Session IDs shall be regenerated for each new session (e.g., each time a user logs in).
6. The session ID shall not be reused or renewed in subsequent sessions.
7. The AMF shall not use persistent cookies to manage sessions but only session cookies. This means that neither the "expire" nor the "max-age" attribute shall be set in the cookies.
8. Where session cookies are used the attribute 'HttpOnly' shall be set to true.
9. Where session cookies are used the 'domain' attribute shall be set to ensure that the cookie can only be sent to the specified domain.
10. Where session cookies are used the 'path' attribute shall be set to ensure that the cookie can only be sent to the specified directory or sub-directory.
11. The AMF shall not accept session identifiers from GET/POST variables.
12. The AMF shall be configured to only accept server generated session ID.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0. section 4.2.5.3]

Section 12: General SBA/SBI Aspects

This general baseline requirements are applicable to all Network Function (NF) within the 5G Core (5GC) utilizing Service-Based Interfaces (SBI), independent of a specific network product class.

2.12.1 No code execution or inclusion of external resources by JSON parsers

Requirement:

Parsers used by Network Functions (NF) shall not execute JavaScript or any other code contained in JSON objects received on Service Based Interfaces (SBI). Further, these parsers shall not include any resources external to the received JSON object itself, such as files from the NF's filesystem or other resources loaded externally.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0Section - 4.3.6.2]

2.12.2 Validation of the unique key values in IEs

Requirement:

For data structures where values are accessible using names (sometimes referred to as keys), e.g. a JSON object, the name shall be unique. The occurrence of the same name (or key) twice within such a structure shall be an error and the message shall be rejected.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0Section - 4.3.6.3]

2.12.3 Validation of the IEs limits

Requirement:

The valid format and range of values for each IE, when applicable, shall be defined unambiguously:

- For each message the number of leaf IEs shall not exceed 16000.
- The maximum size of the JSON body of any HTTP request shall not exceed 2 million bytes.
- The maximum nesting depth of leaves shall not exceed 32.

[Reference: TSDSI STD T1.3GPP 33.117-16.7.0 V.1.0.0Section - 4.3.6.4]

2.12.4 Protection at the transport layer

Requirement:

NF Service Request and Response procedure shall support mutual authentication between NF consumer and NF producer.

All network functions shall support TLS. Network functions shall support both server-side and client-side certificates.

Authentication between network functions within one PLMN can use the following method:
- If the PLMN uses protection at the transport layer, authentication provided by the transport layer protection solution shall be used for authentication between NFs.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.2.2.2]

2.12.5 Authorization token verification failure handling within one PLMN

Requirement:

The NF Service producer shall verify the access token as follows:

- The NF Service producer ensures the integrity of the access token by verifying the signature using NRF's public key or checking the MAC value using the shared secret. If integrity check is successful, the NF Service producer shall verify the claims in the access token as follows: - It checks that the audience claim in the access token matches its own identity or the type of NF service producer. If a list of NSSAIs or list of NSI IDs is present, the NF service producer shall check that it serves the corresponding slice(s).
- If an NF Set ID is present, the NF Service Producer shall check the NF Set ID in the claim matches its own NF Set ID.
- If the access token contains "additional scope" information (i.e. allowed resources and allowed actions (service operations) on the resources), it checks that the additional scope matches the requested service operation.
- If scope is present, it checks that the scope matches the requested service operation.
- It checks that the access token has not expired by verifying the expiration time in the access token against the current data/time.

If the verification is successful, the NF Service producer shall execute the requested service and respond back to the NF Service consumer. Otherwise, it shall reply based on the Oauth 2.0 error response defined in RFC 674. The NF service consumer may store the received token(s). Stored tokens may be re-used for accessing service(s) from producer NF type listed in claims (scope, audience) during their validity time.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.2.2.3.1]

2.12.6 Authorization token verification failure handling in different PLMNs

Requirement:

The NF service producer shall check that the home PLMN ID of the audience claimed in the access token matches its own PLMN identity.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.2.2.3.2]

2.12.7 Correct handling of client credentials assertion validation failure

Requirement:

The verification of the Client credentials assertion shall be performed by the receiving node, i.e., NRF or NF Service Producer in the following way:

- It validates the signature of the JWS as described in RFC 7515.
- If validates the timestamp (iat) and/or the expiration time (exp) as specified in RFC 7519. If the receiving node is the NRF, the NRF validates the timestamp (iat) and the expiration time (exp). If the receiving node is the NF Service Producer, the NF service Producer validates the expiration time, and it may validate the timestamp.
- It checks that the audience claim in the client credentials assertion matches its own type. It verifies that the NF instance ID in the client credentials assertion matches the NF instance ID in the public key certificate used for signing the assertion.

[Reference TSDSI STD T1.3GPP 33.117- 16.7.0 V.1.0.0. Section 4.2.2.2.4.1]

Section 13: Other Security requirements

2.13.1 Remote Diagnostic Procedure – Verification

Requirement:

If the AMF is providing Remote access for troubleshooting purposes/alarm maintenance then it shall be allowed only for authorized users, other than the root user.

All activities performed by the remote user are to be logged with the following parameters:

1. User id
2. Time stamp
3. Interface type
4. Event level (e.g. CRITICAL, MAJOR, MINOR)
5. Command/activity performed and
6. Result type (e.g. SUCCESS, FAILURE).

7. IP Address of remote machine

2.13.2 No System Password Recovery

Requirement:

No provision shall exist for AMF System / Root password recovery.

2.13.3 Secure System Software Revocation

Requirement:

Once the AMF software image is legally updated/upgraded with New Software Image, it should not be possible to roll back to a previous software image.

In case roll back is essential, it shall be done only by the administrator with appropriate non-repudiation controls.

AMF shall support a well-established control mechanism for rolling back to previous software image.

2.13.4 Software Integrity Check -Installation

Requirement:

AMF shall validate the software package integrity before the installation/upgrade stage strictly using the Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” only.

Tampered software shall not be executed or installed if integrity check fails.

2.13.5 Software Integrity Check - Boot

Requirement:

The AMF shall verify the integrity of a software component by comparing the result of a measurement of the component, typically a standard cryptographic hash generated strictly using the Secure cryptographic controls prescribed in Table1 of the latest document “Cryptographic Controls For Indian Telecom Security Assurance Requirements (ITSAR)” to the expected reference value.

2.13.6 Unused Physical and Logical Interfaces Disabling

Requirement:

AMF shall support the mechanism to verify both the physical and logical interfaces exist in the product.

Physical and logical accessible interfaces (except console interface) which are not under use shall be disabled so that they remain inactive even in the event of reboot.

2.13.7 No Default Profile

Requirement:

Predefined or default user accounts (other than Admin/Root) in AMF shall be deleted or disabled.

Chapter 3 Specific Security Requirements

Section 1: Authentication and Key Agreement Procedure

3.1.1 Synchronization failure handling

Requirement:

Upon receiving an authentication failure message with synchronization failure (AUTS) from the UE, the SEAF sends an Nausf_UEAuthentication_Authenticate Request message with a "synchronization failure indication" to the AUSF.

An SEAF will not react to unsolicited "synchronization failure indication" messages from the UE. The SEAF does not send new authentication requests to the UE before having received the response to its Nausf_UEAuthentication_Authenticate Request message with a "synchronization failure indication" from the AUSF (or before it is timed out).

[Reference: TSDSI STD T1.3GPP 33.512 V.16.6.0 section 4.2.2.1.1]

3.1.2 RES* verification failure handling

Requirement:

The SEAF shall proceed by sending *RES**, as received from the UE, in a Nausf_UEAuthentication_Authenticate Request to AUSF and after receiving the Nausf_UEAuthentication_Authenticate Response message from the AUSF, it will proceed as described below:

- If the AUSF has indicated in the Nausf_UEAuthentication_Authenticate Response message to the SEAF that the verification of the *RES** was not successful in the AUSF, or
- if the verification of the *RES** was not successful in the SEAF, then the SEAF shall either reject the authentication by sending an Authentication Reject to the UE if the SUCI was used by the UE in the initial NAS message or the SEAF/AMF shall initiate an Identification procedure with the UE if the 5G-GUTI was used by the UE in the initial NAS message to retrieve the SUCI and an additional authentication attempt may be initiated.

Also, if the SEAF does not receive any Nausf_UEAuthentication_Authenticate Request message from the AUSF as expected, then the SEAF shall either reject the authentication to the UE or initiate an Identification procedure with the UE.

[Reference: TSDSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.1.2]

3.1.3 NAS based redirection from 5GS to EPS

Requirement:

When a UE initiates registration procedure with the AMF, the AMF may redirect the UE from 5GC to EPC by including an EMM cause indicating to the UE that it shall not use 5GC. The following requirements apply to Registration Reject message with an EMM cause which indicates to the UE that the UE shall not use 5GC:

- the AMF shall only send such a Registration Reject message once NAS security has been established between the AMF and the UE; and
- the UE shall only act upon such Registration Reject messages if integrity protected and if UE has verified the integrity of the Registration Reject message successfully.

In networks that support CIoT features in both EPC and 5GC, the operator may steer UEs from a specific CN type due to operator policy, e.g. due to roaming agreements, Preferred and Supported Network Behavior, load redistribution, etc. Operator policies in EPC and 5GC are assumed to avoid steering UEs back and forth between EPC and 5GC.

Section 2: Security mode command procedure

3.2.1 Replay protection of NAS signaling messages

Requirement:

AMF shall support *integrity protection and replay* protection of NAS signaling messages between UE and AMF on the N1 interface.

[Reference: TSDSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.3.1]

3.2.2 NAS NULL integrity protection

Requirement:

NIA0(null security algorithm) shall be disabled in AMF in the deployments where support of unauthenticated emergency sessions is not a regulatory requirement.

[Reference: TSDSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.3.2]

3.2.3 NAS integrity algorithm selection and use

Requirement:

The AMF shall then initiate a NAS security mode command procedure, and include the chosen algorithm and UE security capabilities (to detect modification of the UE security capabilities by an attacker) in the message to the UE. The AMF shall select the NAS algorithm which has the highest priority according to the ordered lists.

[Reference: TS/TSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.3.3]

Section 3: Security in intra-RAT mobility

3.3.1 Bidding down prevention in Xn-handover

Requirement:

In the Path-Switch message, the target gNB/ng-eNB shall send the UE's 5G security capabilities received from the source gNB/ng-eNB to the AMF. The AMF shall verify that the UE's 5G security capabilities received from the target gNB/ng-eNB are the same as the UE's 5G security capabilities that the AMF has locally stored. If there is a mismatch, the AMF shall send its locally stored 5G security capabilities of the UE to the target gNB/ng-eNB in the Path-Switch Acknowledgement message. The AMF shall support logging capabilities for this event and may take additional measures, such as raising an alarm.

[Reference: TS/TSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.4.1]

3.3.2 NAS protection algorithm selection in AMF change

Requirement:

If the change of the AMF at N2-Handover or mobility registration update results in the change of algorithm to be used for establishing NAS security, the target AMF shall indicate the selected algorithm to the UE for N2-Handover (i.e., using NAS Container) and for mobility registration update (i.e., using NAS SMC). The AMF shall select the NAS algorithm which has the highest priority according to the ordered lists.

[Reference: TS/TSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.4.2]

Section 4: 5G-GUTI allocation

3.4.1 5G-GUTI allocation

Requirement:

A new 5G-GUTI shall be sent to a UE only after a successful activation of NAS security.

Upon receiving a Registration Request message of type "initial registration" or "mobility registration update" from a UE, the AMF shall send a new 5G-GUTI to the UE during the registration procedure.

Upon receiving a Registration Request message of type "periodic registration update" from a UE, the AMF should send a new 5G-GUTI to the UE during the registration procedure.

Upon receiving Service Request messages sent by the UE in response to a Paging message, the AMF shall send a new 5G-GUTI to the UE. This new 5G-GUTI shall be sent before the current NAS signaling connection is released or the N1 NAS signaling connection is suspended.

Upon receiving an indication from the lower layers that the RRC connection has been resumed for a UE in 5GMM-IDLE mode with suspend indication in response to a Paging message, the AMF shall send a new 5G-GUTI to the UE. This new 5G-GUTI shall be sent before the current NAS signaling connection is released or the suspension of the N1 NAS signaling connection.

[Reference: TS/TSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.5.1]

Section 5: Security in registration procedure

3.5.1 Invalid or unacceptable UE security capabilities handling

Requirement:

If the REGISTRATION REQUEST message is received with invalid or unacceptable UE security capabilities (e.g. no 5GS encryption algorithms (all bits zero), no 5GS integrity

algorithms (all bits zero), mandatory 5GS encryption algorithms not supported or mandatory 5GS integrity algorithms not supported, etc.), the AMF shall return a REGISTRATION REJECT message.

[Reference: TSDSI STD T1.3GPP 33.512-16.6.0 V.1.0.0 section 4.2.2.6.1]

Section 6: RRCReestablishment in Control Plane CIoT 5GS Optimization

3.6.1 RRCReestablishment in Control Plane CIoT 5GS Optimization

Requirement:

Upon receiving the RAN CP RELOCATION INDICATION message, the AMF shall authenticate the request using the NAS-level security information received in the UL CP Security Information IE and if the authentication is successful initiate the Connection Establishment Indication procedure including NAS-level security information in the DL CP Security Information IE.

In case the AMF cannot authenticate the UE's request, the CONNECTION ESTABLISHMENT INDICATION message does not contain security information, and the NG-RAN node shall fail the RRC Re-establishment.

In case of authentication failure, the NG-RAN node and the AMF should locally release the allocated NG resources, if any.

Section 7: Security in PDU session establishment procedure

3.7.1 Validation of S-NSSAIs in PDU session establishment request

Requirement:

If the Request type IE is set to "initial request" and the S-NSSAI IE contains an S-NSSAI that is not allowed by the network, then the AMF shall send back to the UE the 5GSM message which was not forwarded due to routing failure or congestion control.

Section 8: Network Slice Specific Authentication and Authorization

3.8.1 Network Slice Specific Authentication and Authorization NSSAA revocation

Requirement:

If no S-NSSAI is left in Allowed NSSAI for an access after the revocation and no Default NSSAI can be provided to the UE in the Allowed NSSAI or a previous NSSAA failed for the Default NSSAI over this access, then the AMF shall execute the Network-initiated Deregistration procedure for the access and it shall include in the explicit De-Registration Request message the list of Rejected S-NSSAIs, each of them with the appropriate rejection cause value.

Annexure-I (Definition)

1. AUSF: AUSF is a network function with which SEAF and UDM interact during the authentication of UE.
2. DDOS: DDoS is a distributed denial-of-service attack that renders the victim un-usable by the external environment.
3. GUTI: The purpose of the GUTI is to provide an unambiguous identification of the UE that does not reveal the UE or the user's permanent identity.
4. Downlink: Unidirectional radio link for the transmission of signals from a RAN access point to a UE. Also in general the direction from Network to UE.
5. Medium Access Control: A sub-layer of radio interface layer 2 providing unacknowledged data transfer service on logical channels and access to transport channels.
6. Mobility: The ability for the user to communicate whilst moving independent of location.
7. Network Element: A discrete telecommunications entity which can be managed over a specific interface e.g. the RNC
8. NG-RAN: It is the radio access network introduced for accessing 5G.
9. Node B: A logical node responsible for radio transmission / reception in one or more cells to/from the User Equipment. Terminates the Iub interface towards the RNC.
10. Non-Access Stratum: Protocols between UE and the core network that are not terminated in the RAN.
11. Original Equipment Manufacturer (OEM): manufacturer of communication and its related products under whose brand, the products are sold or proposed to be sold to operators in the country.
12. Packet: An information unit identified by a label at layer 3 of the OSI reference model. A network protocol data unit (NPDU).
13. PLMN Area: The PLMN area is the geographical area in which a PLMN provides communication services according to the specifications to mobile users. In the PLMN area, the mobile user can set up calls to a user of a terminating network. The terminating network may be a fixed network, the same PLMN, another PLMN or other types of PLMN. Terminating network users can also set up calls to the PLMN. The PLMN area is allocated to a PLMN. It is determined by the service and network provider in accordance with any provisions laid down under national law. In general the PLMN area is restricted to one country. It can also be determined differently, depending on the different telecommunication services, or type of MS. If there are several PLMNs in one country, their PLMN areas may overlap. In border areas, the PLMN areas of different countries may overlap. Administrations will have to take

- precautions to ensure that cross border coverage is minimized in adjacent countries unless otherwise agreed.
14. PLMN Operator: Public Land Mobile Network operator. The entity which offers telecommunications services over an air interface.
 15. Protocol data unit: In the reference model for OSI, a unit of data specified in an (N)-protocol layer and consisting of (N)-protocol control information and possibly (N)-user data.
 16. Protocol: A formal set of procedures that are adopted to ensure communication between two or more functions within the same layer of a hierarchy of functions.
 17. QoS profile: a QoS profile comprises a number of QoS parameters. A QoS profile is associated with each QoS session. The QoS profile defines the performance expectations placed on the bearer network.
 18. QoS session: Lifetime of PDP context. The period between the opening and closing of a network connection whose characteristics are defined by a QoS profile. Multiple QoS sessions may exist, each with a different QoS profile.
 19. Quality of Service: The collective effect of service performances which determine the degree of satisfaction of a user of a service. It is characterized by the combined aspects of performance factors applicable to all services, such as;
 - service operability performance;
 - service accessibility performance;
 - service retainability performance;
 - service integrity performance; and
 - other factors specific to each service.
 20. Radio link: A "radio link" is a logical association between single User Equipment and a single RAN access point. Its physical realization comprises one or more radio bearer transmissions.
 21. Radio Resource Control: A sublayer of radio interface Layer 3 existing in the control plane only which provides information transfer service to the non-access stratum. RRC is responsible for controlling the configuration of radio interface Layers 1 and 2.
 22. Registered PLMN (RPLMN): This is the PLMN on which the UE has performed a location registration successfully.
 23. Registration Area: A (NAS) registration area is an area in which the UE may roam without a need to perform location registration, which is a NAS procedure.
 24. Remote Access: The access which is not Local access. This includes access from the EMS (Element Management System) network, and access that originates or passes through the internet.
 25. RRC Connection: A point-to-point bi-directional connection between RRC peer entities on the UE and the UTRAN sides, respectively. An UE has either zero or one RRC connection.

26. SEAF is an entity which is subsumed by AMF which communicates with UE and AUSF during device authentication.
27. Security: The ability to prevent fraud as well as the protection of information availability, integrity, and confidentiality.
28. Serving Network: The serving network provides the user with access to the services of the home environment.
29. Software refers to the programs and data components which are usually stored on erasable media (e.g., disk), that can be dynamically written and modified during execution. Two general categories of software are system software and application software.
30. Subscriber: The responsibility for payment of charges incurred by one or more users may be undertaken by another entity designated as a subscriber. This division between use of and payment for services has no impact on standardization
31. Transmission or Transport is the transfer of information from one entity (transmitter) to another (receiver) via a communication path.
32. Universal Subscriber Identity Module (USIM): An application residing on the UICC used for accessing services provided by mobile networks, which the application is able to register on with the appropriate security.
33. Uplink: An "uplink" is a unidirectional radio link for the transmission of signals from a UE to a base station.
34. User Equipment: A device allowing a user access to network services. The interface between the UE and the network is the radio interface. A User Equipment can be subdivided into a number of domains, the domains being separated by reference points.

Annexure-II(Acronyms)

5GC	-	5G Core Network
5GMM	-	5GS Mobility Management
5GS	-	5G System
5GSM	-	5G Session Management
AF	-	Application Function
AS	-	Access Stratum
AUSF	-	Authentication Server Function
AUTS	-	Authentication failure message with synchronization failure
CIoT	-	Cellular Internet of things
CLI	-	Command Line Interface
CM	-	Connection Management
CP	-	Control Plane
DDoS	-	Distributed Denial of Service
DL	-	Downlink
DN	-	Data Network
EMM	-	EPS Mobility Management
EPC	-	Evolved Packet Core
EPS	-	Evolved Packet System
gNB	-	5G Next Generation base station
GTP-C	-	GPRS Tunneling Protocol Control Plane
GTP-U	-	GPRS Tunneling Protocol User Plane
GUI	-	Graphical User Interface
GUTI	-	Globally Unique Temporary Identifier
HTTP	-	Hypertext Transfer Protocol
HTTPS	-	Hypertext Transfer Protocol Secure
ICMP	-	Internet Control Message Protocol
IE	-	Information Element
IP	-	Internet Protocol
ISO-OSI	-	International organization of Standardization – Open System Interconnection
JSON	-	JavaScript Object Notation
JWS	-	JSON Web Signature
JWT	-	JSON Web Token
LMF	-	Location Management Function
N3IWF	-	Non-3GPP Interworking Function
NAS	-	Non-Access Stratum
NEF	-	Network Exposure Function

NF	-	Network Function
NG	-	Next Generation
ng-eNB	-	Next Generation e-NodeB
NG-RAN	-	Next Generation Radio Access Network
NRF	-	Network Repository Function
NSAC	-	Network Slice Admission Control
NWDAF	-	Network Data Analytics Function
O&M	-	Operations and Maintenance
OAM	-	Operations Administration Maintenance
OS	-	Operating System
PCF	-	Policy Control Function
PDR	-	Packet Detection Rule
PDU	-	Protocol Data Unit
PLMN	-	Public Land Mobile Network
QoS	-	Quality of Service
RAM	-	Random Access Memory
RAN	-	Radio Access Network
RAT	-	Radio Access Technology
RES	-	Response
REST	-	Representational State Transfer
RFC	-	Request For Comments
RM	-	Registration Management
RRC	-	Radio Resource Control
S-NSSAI	-	Single - Network Slice Selection Assistance Information
SBI	-	Service Based Interfaces
SEAF	-	Security Anchor Function
SEPP	-	Security Edge Protection Proxy
SMF	-	Session Management Function
SNPN	-	Stand Alone Non-Public Network
SUCI	-	Subscription Concealed Identifier
TA	-	Tracking Area
TNGF	-	Trusted Non-3GPP Gateway Function
TSTL	-	Telecom Security Testing Laboratory
UDM	-	Unified Data Management
UDR	-	Unified Data Repository
UE	-	User Equipment
UL	-	Uplink
UPF	-	User Plane Function
URL	-	Uniform Resource Locator
URLLC	-	Ultra Reliable Low Latency Communication

Annexure-III (List of Submissions)

1. Source Code Security Assurance (against test case 2.3.3)
2. Known Malware and backdoor Check (against test case 2.3.4)
3. No unused Software (against test case 2.3.5)
4. Communication matrix (against test case 2.3.6)
5. No Unused Functions (against test case 2.4.1)
6. Avoidance of Unspecified Wireless Access (against test case 2.4.3)
7. Cryptographic Based Secure Communication (against test case 2.6.1)
8. Cryptographic Module Security Assurance (against test case 2.6.2)
9. Cryptographic Algorithms implementation Security Assurance (against test case 2.6.3)

Annexure-V (List of Cryptographic Controls)

Table-1 containing the list of Cryptographic Controls prescribed in Indian Telecom Security Assurance Requirements (ITSAR) has been reproduced here.

TABLE 1

Sl No	Cryptographic Control Category	Prescribed Cryptographic Control
1	Symmetric Key encryption and decryption	AES-128, AES-192, AES-256 and above
2	Asymmetric Key encryption and decryption	RSA-2048 and above
3	Key Exchange	Diffie-Hellman-2048 and above
		RSA-2048 and above
4	Digital Signature	DSA-2048 and above
		ECDSA 224-255 , 256 and above
		RSA-2048 and above
5	HASH	SHA-224 ,SHA 256, SHA-512/224 ,SHA3-224 and above
